

Handling short instructions for

TINA

power supply:

If you want to use the device you have to supply power to it first.

The device can either be powered with 5V via the USB connector or with 24V via the included phoenix connector (*attention: polarity must be respected*).

access to the web interface:

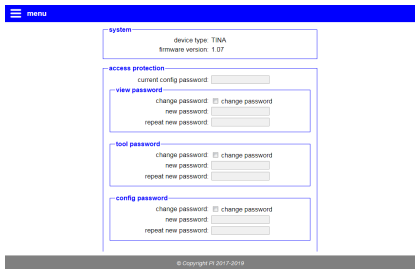

After you have supplied power to your device you have the ability to access the web interface of the device.

The *TINA* device provides an own WLAN network via its integrated WLAN interface. The WLAN network has the name „TINA WiFi“. This network is not encrypted, so you can connect to it easily without entering a password or something else.

If you are connected with the WLAN network of the *TINA* device your computer or smart phone get's an IP address automatically via DHCP. If your computer / smart phone is not configured for DHCP you can either configure your network card to use an IP address between 192.168.1.2 and 192.168.1.254 or activate DHCP on it.

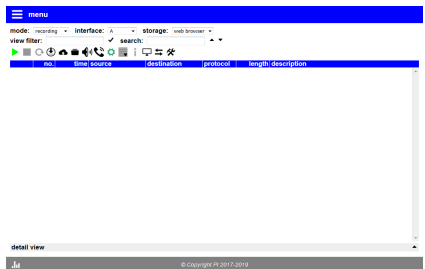

If your computer doesn't have a WLAN interface or if you don't want to use it you can still access the *TINA* device through the LAN-A interface. On this interface no DHCP server is running, which means that you have to configure the IP address of your computer manually. Therefore you just have to assign an IP address from the range of 192.168.2.2 to 192.168.2.254 to your PC's network card.

Now you can open an internet browser (e. g. Mozilla Firefox) and enter the IP address 192.168.1.1 (for WLAN) or 192.168.2.1 (for LAN-A) in the address line. Next you should see the web interface of the **TINA** device with a hint window and an input field (see picture on the right side). On this page you have to enter the serial number of the device, which can be found on the bottom of the device.

After you have entered the serial number the device is unlocked and can be used normally. To be able to customize the configuration directly, you will be redirected to the configuration page (see picture on the left) after entering the serial number. We recommend that you check and maybe customize the configuration.

As soon as you have saved the configuration via the “submit configuration” button on the configuration page, your browser will redirect you to the start page of the device (see picture on the right).

Analyzing the network traffic:

The **TINA** device has the ability to analyze the network traffic between two or more LAN subscribers. First you have to connect the first subscriber with a LAN cable to the interface A of the **TINA** device. Next you can connect the second subscriber with another cable to the interface B. If you have more than two subscribers you can connect a switch or hub to one or both interface(s).

For analyzing and controlling the network traffic you have several pages on the web interface: “overview”, “network scan”, “network tools” and “DHCP clients”

An detailed description as well as an explanation of the single web pages can be found in the manual of this device. The user manual can be found on the product page of our web page under the download section *Documentation* → *Handbook TINA*.

Programming of S7-PLC-devices via LAN

S7-PLC with PPI, MPI, Profibus connection, but data should be read/written via network?

Ethernet-CP cannot be used because of the effort (hardware-configuration), price, space in the rack, availability. Plug S7-LAN-module/MPI-LAN-cable into a free bus-connector, assign the IP-address and the PLC can be reached via the network. There is no need to invest any more effort. The adapter can be parameterized via an integrated web-server or a configuration-tool. No changes to the S7-PLC are necessary to operate the adapter.

The adapter can also be used to implement PUT/GET-connections to other controls, but the PLC-program must be changed for this. Other PLCs can just as well read/write data from this controller via PUT/GET; nothing needs to be changed in the PLC program.

Automation very easy: Connect, parameterize and work.

Standalone recording

With the integrated SD-card-slot you back-up the recorded data in the device and don't need an external memory. Nevertheless you can send additional the data via FTP to a FTP-server.

Interface switch for the S5

PG-interface of the S5-PLC occupies with a panel and program changes in the controller should be performed? No desire/leisure/possibility to plug permanently between panel and programming-device?

Connect the device from the PG-switch-series to the S5-PLC as well as panel and programming-device, and you decide who from the two participants (PANEL or PG) with the control communicates. Whether with toggle-switch (PG-SWITCH) or with 24V DC (PG-SWITCH-II) or permanently connected by preceding [PANEL and PLC permanently connected, communication is running; As soon as PG is plugged into PG is also switched; disconnect PG and panel has access] (PG-SWITCH-III), switching to your requirements and no permanent change.
